Self-Closing

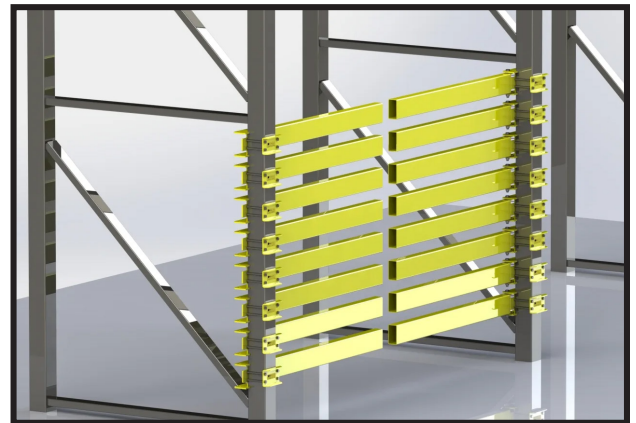

PICKSAFE™ FINGER GATES (PSFG)

PROTECT WORKERS FROM FALLS WHEN PICKING OR STACKING PALLETS

The new PickSafe™ Finger Gate creates a fall barrier for workers picking pallets or stacking empty pallets while on an elevated work surface. This ANSI- and OSHA-compliant gate is pushed open by a pallet, and then durable springs allow it to self-close as the pallet is unloaded or clears the gate. The PickSafe Finger Gate can utilize up to eight arms (and as few as one), with each arm of the gate operating independently from the others. This gate is ideal for pallet flow rack-mounted application and rack picking stations within large warehouses and distribution centers.

PickSafe™ Finger Gate Benefits

- **Improved Fall Protection** – This gate provides fall protection on elevated work areas where gravity-fed pallets are utilized and for walkways between rollers.
- **Increased Material Handling Efficiency** – This gate is pushed open by a pallet and then durable springs allow it to self-close as the pallet is unloaded or clears the gate.
- **100% Customizable** – Each arm is independent, and the gate can utilize as many arms as you need (up to eight arms and as few as one) to safely secure your product and its flow.
- **Easy To Install** – Minimal tools are required, there's no drilling necessary and mounting hardware is included.
- **Meets OSHA And ANSI Requirements** – Each individual arm meets the ANSI/OSHA requirement of being able to withstand 200 lbs. of weight.
